10 minute quarantine or hospital tank

Every fish owner should have a quarantine or hospital tank for when you get new fish or if a fish becomes ill but so many don't.

Rather than keep a hospital or quarantine tank set up all the time, get one of these large tubs but don't fill it, just keep it handy. Get an internal filter (any type will do) and run that in your main tank alongside your other existing filter. That way, if a fish becomes ill or you buy a new fish, you can use existing tank water, add the small internal filter to the tub and bingo, you have a ready made fully cycled hospital tank. I have to do this all the time with the fish rescue

Only use the stronger more expensive type.

These storage boxes from B&Q are even more ideal. They are strong, water tight, movable and also come in a range of different sizes. Also available in clear.
